

1. Transfer outputs

Accepted intercept state, target state, and lead-time context from the transfer solve.

2. Event-level gate

Compute relative speed and required intercepted mass; discard non-finite or non-positive events.

3. Encounter-plane overlap

Propagate released dust uncertainty and project dust plus target uncertainty onto the encounter plane.

4. Mission dust scoring

Convert overlap to released mass, then aggregate successful-event burdens into mission-level objectives.
